

MenaWatt

POWER: 9V battery or 9V power supply not exceeding 200ma,
battery access is through the four screws on the back plate

POWER ADAPTER: Negative Center - Positive Ring

Daisy chaining is not recommended

After many years of repairing damage from mediocre power supplies, Menatone now only recommends

Voodoo Labs Pedal Power supplies.

Use all other supplies at your own risk!

Controls:

GAIN-BRILLIANT/NORMAL

these are the first gain controls in the circuit.
think of them in parallel like you jumpered
together a 4 input vintage amp. the NORMAL is thick
and fat, and the BRILLIANT is bright with a tighter bottom

EQ

the equalizer is the normal Treble, Middle, and Bass,
I recommend starting with everything at noon and adjusting
to taste from there.

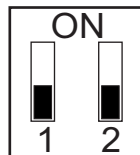

VOL

this sets the overall volume level of the pedal

INTERNAL TRIMPOT

This is the Power Gain control. Think of it as a master volume
on an amp. Turn up for more power tube type of distortion

INTERNAL AMP MATCH SWITCHES

AMP MATCH

These switches offer different levels
of treble cut. Both off is the brightest
setting. Factory setting is switch 2 on.

**The MenaWatt has a lot of gain,
it may oscillate at higher gain levels.**
